VENTILATION OF A LARGE ROOM

Ventilation of a large room

external heat inflow

internal sources

moisture
heat

Ventilation
1. Air refresh
2. Air mobility
3. Heat
3. Humidity

Ventilation of a large room

Natural convection:

1. environment responsiveness
2. nonuniformity
3. coupling of air temperature, humidity and mobility

Ventilation of a large room

Extract and input ventilation:

1. zonal control
2. comfort enhancement
3. efficient conditioning

CONCLUSIONS:

- 1.** Complicated air circulation structure in a large room essentially distorts rated performances of inflow units
- 2.** Local structure and intensity of air motion around hot of cold surfaces may govern the temperature and humidity levels in the room as a whole
- 3.** Reliable prediction of large room climate is possible providing full aerophysic modeling with high detaling (10^7 nodes and more)
